

05/02/2023

Functions: are the code block which perform some well defined task acc. to user preference to attain some output.

i.e

return type . fun Name { }   
 ↗ parameter  
 ↓  
 input parameters  
 { }  
 Body (performing task)

- \* Function are more readable
- \* can be re-use & refer.

ex: void printName ( ) { }   
 ↙ ↗ parameter  
 void ↙ Function Name  
 return type ↙ should be understandable  
 ie NULL ↙ code  
 won't return ↙

→ Argument: The value / input that is passed to the function, said to be argument.   
 ↙ also known as Actual Parameter when function is called.

→ Parameters: The value / input that are associated with the definition of func. said to be Parameters.   
 ↙ also known as Formal Parameter.

Parameter are local variable can be used to scope of that function.   
 Argument are global

\* int main ( ) { }   
 ↙ ↗ calling / compiler execute the code from main func.  
 return type

return 0; → indicates the successfully execution of code.

return 0 → indicates the successfully execution of code it did what it was meant to do.

return 1: it will show error while executing code.  
didn't do the way to use main for

return - 1:

\* Why to use functions?

- Not to create lengthy & bulky codes
- Increase readability
- Re-use or prefer acc. to our preference.

\* Function call stack:

Stack: basically consists of push and pop of functions inside a bucket i.e. FILO [First In Last out].

↳ It is a Data structure.

ex:

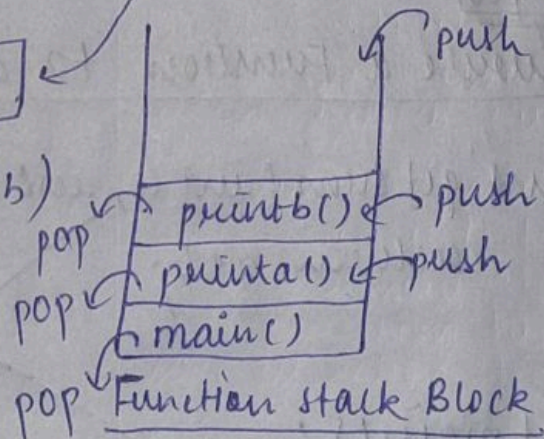

```
int main() {  
    int a = 5;  
    printa(a);  
    return 0;  
}
```

```
void printa(int a) {  
    int b = 3;  
    cout << a;  
    printb(b);  
}
```

```
void printb(int b) {  
    cout << b;  
}
```

5  
a  
(print a)

3  
b  
(print b)

\* Pass by value: Creating copy of any variable to the function parameters. i.e. making copy of variable <sup>declared</sup> inside main func and using that copy as a parameter to another function.

```

ex: int main() {
    int num = 12;
    num++;
    ++num;
    print(num);
    --num;
    cout << num;
}

```

```

void print(num) {
    ++num;
    num++;
    cout << num;
    --num;
}

```

$13 = \text{num}++$   
 $14 = ++\text{num}$   
 num

Now num stores value  
 i.e.  $\boxed{\text{num} = 14}$

for this  $--\text{num}$  it will take main function num value  
 i.e. after updation  $\boxed{14}$   
 num

$--\text{num} = 14 - 1 = 13$   
 $\boxed{13}$   
 $--\text{num}$

$15 = ++\text{num}$   
 $16 = \text{num}++$   
 $\boxed{14}$   
 num

Here  $\text{num} = 16$

i.e.  $\boxed{16}$   
 num

$--\text{num} = 16 - 1 = 15$

This is an example of pass by value.

### Examples

① Write a Function to add 2 Numbers.

```

int getSum(int a, int b) {
    return a + b;
}

```

Pass by value i.e. creating copy of variable.

```

int main() {

```

```

    int a, b;

```

```

    cout << "Enter value of a: "; cin >> a;

```

```

    cout << "Enter value of b: "; cin >> b;

```

```

    int sum = getSum(a, b);

```

```

    cout << "Sum of " << a << " and " << b << " is " << sum;

```

```

    return 0;
}

```

### output

Enter the value of a: 5  
Enter the value of b: 8  
Sum of 5 and 8 is 13

### ② Find max of 3 Numbers

```
void getMaxOfThree(int x, int y, int z) {
```

```
    if (x > y && x > z) {  
        cout << x;
```

```
    }  
    else if (y > z && y > x) {  
        cout << y;
```

```
    }  
    else {  
        cout << z;
```

```
    }
```

output:

Enter num1: 4

Enter num2: 10

Enter num3: 2

10

```
int main() {
```

```
    int num1, num2, num3;
```

```
    cout << "Enter num1 "; cin >> num1;
```

```
    cout << "Enter num2 "; cin >> num2;
```

```
    cout << "Enter num3 "; cin >> num3;
```

```
    getMaxOfThree(num1, num2, num3);
```

```
    return 0;
```

```
}
```

### ③ counting from 1 to N:

```
void printSeries(int n) {
```

```
    for (int i = 1; i <= n; i++) {
```

```
        cout << i << " ";
```

```
    }
```

Output:

n=10

1 2 3 4 5 6 7 8 9 10

```
int main() {
```

```
    int num;
```

```
    cout << "Enter the num: "; cin >> num;
```

```
    printSeries(num);
```

```
    return 0;
```

```
}
```

④ Write a function of student's grade Problem:

```
char gradeCalc(int marks) {
    switch (marks/10) {
        case 10: return 'A'; break;
        case 9: return 'A'; break;
        case 8: return 'B'; break;
        case 7: return 'C'; break;
        case 6: return 'D'; break;
        default: return 'E';
    }
}
```

output:  
Enter the marks: 81  
B

```
int main() {
    cout << "Enter the marks: "; cin >> marks;
    char grade = gradeCalc(marks);
    cout << grade;
    return 0;
}
```

⑤ Sum of Even no upto N:

```
int evenSum(int number) {
    int sum = 0;
    for (int i = 2; i <= number; i += 2) {
        sum = sum + i;
    }
    return sum;
}
```

output  
Enter the number = 10  
30  
i.e.  $2 + 4 + 6 + 8 + 10 = 30$

```
int main() {
    cout << "Enter the number: "; cin >> num;
    int sum = evenSum(num);
    cout << sum;
    return 0;
}
```

## Extra

⑥ Write a function to display area of circle.

```
float areaOfCircle (int radius) <
    return 3.14 * radius * radius;
```

}

```
int main() <
```

```
    int radius;
```

```
    cout << "Enter the radius: "; cin >> radius;
```

```
    float area = areaOfCircle (radius);
```

```
    cout << "The area of circle having radius " << radius << " is " << area;
```

```
    return 0;
```

}

## Output

radius = 9

The area of circle having radius 9 is 254.34.

⑦ Find num in Odd or even :

```
void checkNum (int num) <
```

```
    if (num % 2 == 0) <
```

```
        cout << "Num is even";
```

```
    }
```

```
    else <
```

```
        cout << "Num is odd";
```

```
    }
```

}

```
int main() <
```

```
    int num;
```

```
    cout << "Enter the num: "; cin >> num;
```

```
    checkNum (num);
```

```
    return 0;
```

}

## Output

Enter the Num: 28103

Num is odd

Enter the Num: 285688

Num is even

⑧ Find factorial using function

```
int factorial (int number) <
```

```
    int fact = 1;
```

```
    for (int i = number; i > 0; i--) <
```

```
        fact = fact * i;
```

```
    }
```

```
    return fact;
```

}

```
int main() <
```

```
    int num;
```

```
    cout << "Enter the num: "; cin >> num;
```

```
    int fact = factorial (num);
```

```
    cout << fact;
```

```
    return 0;
```

}

## Output

enter the num = 4

fact = 4

4 > 0 fact = 4

3 > 0 fact =  $4 \times 3 = 12$

2 > 0 fact =  $12 \times 2 = 24$

1 > 0 fact =  $24 \times 1 = 24$

0 > 0 No fact = 24

## ⑨ check Number is prime or not?

```
bool checkPrime (int n) {
```

```
    bool prime = true;
```

```
    for (int i = 2; i <= n-1; i++) {
```

```
        if (n % i == 0) {
```

```
            prime = false;
```

```
            break;
```

```
        }
```

```
    } return prime;
```

```
int main () {
```

```
    int num;
```

```
    cout << "Enter the num: "; cin >> num;
```

```
    bool check = checkPrime (num);
```

```
    if (check) {
```

```
        cout << "It is Prime";
```

```
    }
```

```
    else {
```

```
        cout << "Not a Prime";
```

```
    }
```

```
    return 0;
```

## Output:

enter the num = 21

Not a prime

Enter the num = 30

Not a prime

Enter the num = 23

It is Prime.

⑩ Print all prime numbers from 10 to N

```
bool checkPrime(int n) {  
    bool prime = true;  
    if (n == 0 || n == 1) {  
        prime = false;  
    }  
    for (int i = 2; i <= n-1; i++) {  
        if (n % i == 0) {  
            prime = false;  
            break;  
        }  
    }  
    return prime;  
}
```

```
int main() {  
    cout << "Enter the num: "; cin >> num;  
    for (int i = 1; i <= num; i++) {  
        bool check = checkPrime(i);  
        if (check) {  
            cout << i << " ";  
        }  
    }  
    return 0;  
}
```

Output  
Enter the num = 10  
2 3 5 7

Enter the num = 20  
2 3 5 7 11 13 17 19.
